

WHAT IS CLAIMED IS:

1. A golf club shaft, comprising a fiber reinforced resin,
whose outer diameter is set to 9.5 to 12mm in at least one portion
of a range from a tip thereof disposed at a head-mounting side to
5 a position located at 25% of a distance from said tip to a butt
thereof; and a minimum value of a flexural rigidity (EI) in said
range is distinctively set to 1.00 to 2.50 kg·m².

2. The golf club shaft according to claim 1, wherein a
reinforcing layer is formed in said region disposed from said tip
10 to said position located at 25% of said distance from said tip to
said butt, and

said reinforcing layer includes:

a straight layer consisting of a prepreg whose reinforcing
fiber has a tensile modulus of elasticity of 5 to 15 ton/mm² and
15 is substantially parallel with an axis of said shaft; and

an angular layer consisting of a prepreg whose reinforcing
fiber has a tensile modulus of elasticity of 24 to 40 ton/mm² and
an orientation angle of ± 20 to 65° with respect to said axis of
said shaft.

20 3. The golf club shaft according to claim 2, wherein a ratio
of a weight of said reinforcing straight layer to a weight of said
reinforcing angular layer is set to 0.5 to 1.0.
